Documentation

Project was difficult to understand at first. Was unsure of what exactly to do and how to start. Eventually, decided to just use the Kent State unix servers instead of downloading linux through VM because my laptop is not good enough to host two virtual machines (I already have ubuntu). That solved some of my issues. Once I read through some examples from GeeksForGeeks, I got an idea of how to start. A lot of the rest was explained by tutors, and I understand what I'm doing right now. Overall, the process went relatively smoothly, however I do feel some more instructions could be given on the actual programming bit from instructors in the future. It was a lot of learning on my own, which I do appreciate, however, it did take a lot of time.
